

# Insights and Inferences

## **Steps taken for Data pre-processing:**

- Keeping the data centered to the company employees, and hence removing records of outside employees
- Limiting the data to India, since foreign records of 60 rows won't add any value to the final analysis
- Getting rid of all the nulls, we're left with 66364 of 78682

## **Inferences:**

- '**Web**' happens to be the most preferred mode for attending the meeting for the company employees
- Employees joining from '**Delhi**' stay connected in the call for a longer duration of time
- On more than **63%** (*42000 records out of 66000*) of occasions, employees spoke for no more than *20 min*. Moreover, **70%** (*46000 records*) of the time, employees kept their camera on for a mere *10 minutes*, out of which **~ 75%** attended the meeting in complete audio mode, highlighting the unwillingness to collaborate with other company employees present in the meet
- As the duration of the call exceeds **2 hours**, the overall participation of the attendees essentially decreases, as almost no one keeps their camera on, asking for a need to keep the meetings short and to the point, thereby by making it more engaging and happening.
